

SYNTHETIC DEVELOPMENT DRAFT — version-aware correction text; unsent and unpublished.

Proposed correction to the fictional public snapshot v1

Affected object: “SYNTHETIC older public snapshot v1 — preserve verbatim,” supplied as published-snapshot-v1.md. The snapshot is fictional; no real publication, DOI, journal correction or publisher action is asserted. The original file and the local archived copy are preserved byte for byte.

Draft correction notice

The older snapshot reported the target-mixture A–B mean as -0.30 score. The supplied authoritative version 2 result memo reports -0.20 , consistent with $0.8 \times (-1.00) + 0.2 \times 3.00$. The target interval remains $[-0.60, 0.20]$; the $g1$ and $g2$ estimates remain -1.00 and $+3.00$, and the equal sampled-mixture estimate remains $+1.00$. The source of the older numerical discrepancy is not documented; no new analysis or replicated bootstrap is claimed.

The earlier title and interpretation claiming universal causal advantage and equivalence should be withdrawn. The two stratum point estimates have opposing directions; $g2$ favors B. The supplied record contains no causal assignment or adjustment, and the interval's inclusion of zero does not establish equivalence. No equivalence margin or registered equivalence test is supplied. The appropriate interpretation is a diagnostic of composition dependence: equal sampled and target mixtures give opposite aggregate point-estimate directions, with uncertainty around the target contrast.

The older statement that open raw data were available should also be withdrawn. The governing fixture license permits local analysis, code and aggregate-result sharing but prohibits redistribution of raw unit-level records and identifiers. No approved access arrangement or open-data deposit is supplied. Any controlled-access proposal requires a license-compatible authorization by the responsible holder.

Impact and version linkage

This is a substantive numerical, interpretation and access correction, not a typographical-only change. It affects the snapshot title, target estimate, principal conclusions and data-availability statement. The target estimate remains negative, and the interval still includes zero; neither fact rescues the former universal, causal or equivalence claim. The revised v3 manuscript, Figure 1 caption and Supplement S1 consistently report the memo's -0.20 estimate and bounded diagnostic interpretation.

Object	Role and relationship	Status
published-snapshot-v1.md	Older fictional public wording; target –0.30 and unsupported claims	Preserved, not overwritten
evidence.md / draft-v2.md	Supplied authoritative v2 results / working draft	Frozen source, unmodified
manuscript-v3-anonymous.md / caption-v3.md / supplement-v3.md	Local developmental correction using v2 result record	Draft, not accepted or published
correction-note-v1-draft.md	Proposed notice linked to v1 and v3	Unapproved, unsent, unpublished

No newer DOI or repository identifier is invented. Author approval, ethics determination, recipient, formal correction process and publisher approval remain UNKNOWN. This notice is prepared for author review only.
